A free VPN, or virtual private network, is a wonderful thing — as many things that are free tend to be. But, as is also often the case, you get what you need. So which is the best VPN for you, free or paid? The price difference between these two options is clearly big, going from totally free to the average monthly price of a VPN which is about \$10. But subscribe for longer and you save money that way. The downside of going for a free price will have a limit on your data usage in most cases, be it daily or monthly. Once you've gone over that data limit you will no longer be able to use the VPN. There is one unlimited service, but there are other limits, more on that below. So a free VPN is a great option for those that want to check emails in bulk, stream music, and watch online video — a paid VPN is going to be needed. How much data does a free VPN offer? One of the best free VPN options is Hotspot Shield VPN, which also has a premium version should you want to upgrade. At its most basic, the free service is good for up to 500MB of data per day. Not a small amount for browsing websites, but very little if you want to watch your latest Netflix show, for example. A monthly data allowance of 15GB, which that equates to, does sound like a lot but since you can't roll over that daily limit, it's not that much. But, of course, it depends on what you need it for. For bulk use, you might want to go for a service like Windscribe which offers a lower 10GB data allowance but it's spread over the month so you can use that as you need. Tweet about the service and you'll get an extra 5GB, and each time you get an extra 5GB, and each time you get an extra 5GB, and each time you refer a friend you get an extra 1GB also. Proton VPN has no limits on data but, before you get an extra 5GB, and each time you refer a friend you get an extra 1GB also. Proton VPN has no limits on data but, before you get an extra 1GB also. Proton VPN has no limits on data but, before you get an extra 1GB also. Proton VPN has no limits on data but, before you get an extra 1GB also. Proton VPN has no limits on data but, before you get an extra 1GB also. Proton VPN has no limits on data but, before you get an extra 1GB also. Proton VPN has no limits on data but, before you get an extra 1GB also. Proton VPN has no limits on data but, before you get an extra 1GB also. Proton VPN has no limits on data but, before you get an extra 1GB also. Proton VPN has no limits on data but, before you get an extra 1GB also. and there are only three server locations plus speeds can be limited. You will be throttled on speed if a lot of paid users are online as they get priority. There is also no P2P torrent support from this service. What are the problems with a free VPN? Aside from the data limit, there is also the issue of connection speed. A service like Hotspot Shield premium has over 1,800 servers across over 80 international locations. But if you go for the free version you won't be able to pick and choose servers. The result is spotty speeds. You could get lucky and have a really great connection at a local server. But you could end up connecting to a slower server that's really far away and struggles with speed. In the case of Windscribe, which offers more liberal free data use, it is limited to servers in the U.S., UK, Hong Kong, and Canada only. Another issue is that with the free service you'll have to put up with ads. Yup, nothing is ever really free, as they say. But if you don't mind pop-ups then this could be a good option to save you a bit of money and still get you the security of a VPN. What's good about a free VPN? Despite being free, you'll still be accessing secure servers. This means that your location and identity, via your IP address, will be hidden. That helps you stay anonymous online as well as more secure than using an open connection. In the case of Hotspot Shield you get military-grade encryption, meaning your data is kept super secure in transit so even if someone were to, somehow, get hold of it, they wouldn't be able to decipher it anyway. What does a paid VPN get me? This is the key question as you're committing to a monthly or annual payment for a service. Of course, you'll get all the security of an encrypted connection but you'll also get unlimited data. That means you could be abroad and still watch all your favorite Netflix shows without the worry of running low on your data allowance. The other important thing to keep in mind is that you're in Europe, say. This is also really helpful if you're somewhere like China where VPN use is restricted and you may need to try a few server locations to actually get online. Best VPN Services 2020 Speeds are usually faster on paid-for VPN services. Although there is the free option, Speedify, which is all about rapid connections but that will be limited with just 1GB of data allowance per month. We recommend ExpressVPN for anyone looking to pay for a VPN. What is the best free VPN? Depending on what you need, as an all-around service, Hotspot Shield is great for free access to 15GB of data per month at 500MB per day with decent speeds and top security. Want to get bulk data that you use when you like? Then the Windscribe service with 10GB per month is for you. If it's all about speed and you don't need much data then Speedify is ideal. Don't care about speed but want unlimited data? Go ProtonVPN.What is the best paid VPN?If you've decided what you need can't be provided by a free VPN then you'll want to take a look at ExpressVPN. In all our testing it's come out on top time after time. It's fast, secure, has great customer service with 24/7 live chat, gets you Netflix abroad, supports torrents, and works on five devices at once with lots of clients to suit all sorts of tech. The pricing is average but what you get is anything but that. How do I find the best VPN deals? Free versions not cutting it for you? You don't have to go broke while signing up for a new VPN service. We've rounded up all the best VPN deals for you. We keep it up to date with coupons, price drops, and other promotions that are available. Be sure to check back often! We test and review VPN services in the context of legal recreational uses. For example: 1. Accessing a service from another country (subject to the terms and conditions of that service). 2. Protecting your online security and strengthening your online privacy when abroad. We do not support or condone the illegal or malicious use of VPN services. Consuming pirated content that is paid-for is neither endorsed nor approved by Future Publishing. So, you're wondering what the best VPN uses are, and you've ended up on this comprehensive page. Thankfully, it's the only place you'll need to be. Below, we'll be running through pretty much all the top VPN uses you might have thought of - plus some you might not have. Because it's pretty long, at the top of this page you'll find a list of 'Jump To' tabs - start your journey there and click on the VPN uses you'd like to know more about. You'll be transported to that section without having to scroll for miles to find it. Or, feel free to scroll if that's your style. We'll start off with a brief introduction about how VPNs actually work, and then we'll dive into a whole bunch of the best uses of VPN. We think it's good practice to not only know what something does, but how it does it, too. If you're already well-versed in the tech, again, just click on the tabs above to explore what a VPN can do for you. How it works on the tabs above to explore what a VPN work? In simple terms, a VPN works by encrypting all your information and sending it through a 'tunnel' to its destination. It does this by redirecting your internet connection from your internet service provider's (ISP) servers to its own. The most impressive VPNs have thousands of servers in 94 countries. This means that not only can you make sure all your data is encrypted and secure, but you can also virtually relocate yourself and surf the web as if you were actually in those countries. This is great for streaming (click 'stream blocked content' up top to learn more) and avoiding government censorship (click 'stream blocked content' up top to learn more) and avoiding government censorship (click 'stream blocked content' up top to learn more) and avoiding government censorship (click 'stream blocked content' up top to learn more) and avoiding government censorship (click 'stream blocked content' up top to learn more) and avoiding government censorship (click 'stream blocked content' up top to learn more) and avoiding government censorship (click 'stream blocked content' up top to learn more) and avoiding government censorship (click 'stream blocked content' up top to learn more) and avoiding government censorship (click 'stream blocked content' up top to learn more) and avoiding government censorship (click 'stream blocked content' up top to learn more) and avoiding government censorship (click 'stream blocked content' up top to learn more) and avoiding government censorship (click 'stream blocked content' up top to learn more) and avoiding government censorship (click 'stream blocked content' up top to learn more) and avoid (click 'stream blocked content' up top to learn more) and avoid (click 'stream blocked content') and avoid (click 'stream blocked just staying on home turf, using your VPN's secure encryption also allows you to browse anonymously and generally have a more private experience when online - and who doesn't want that?So, browse the tabs up top or scroll on to find out more about all of the most popular - and some unusual - VPN uses.PROTECT YOUR IDENTITY(Image credit: OpturaDesign / Shutterstock.com) VPN uses: Protect your identityWhen most people think of a VPN, they think of a VPN is tough encryption - usually AES-256 combined with a secure protocol - and this means every last bit of traffic sent through the VPN is unreadable by anyone who intercepts it. That interceptor might simply be your ISP trying to log or limit what you use their connection for, or it could be a malicious individual or program looking to steal your data. Who or whatever they are, VPNs avoid them by using a 'tunnel' that starts at your device and ends at your destination - be that Netflix, a geo-blocked social network or your data is at risk, so a VPN eliminates that by both encrypting your data and routing your connection through one of its own servers, masking your IP address and any other identifying information. If you've chosen a quality, zero-logging provider, you should be able to trust your VPN's servers more than your ISP's. In essence, a VPN removes or encrypts any information that could link you or your device to your activity on the web. It's a one-stop shop for taking back personal privacy online. Most private VPN - See which VPN offers the best privacy features STREAM BLOCKED CONTENTVPN uses: Stream geo-blocked contentIt's now the norm to get all our content from online streaming services, and while there's more selection than ever before, a VPN can expand your entertainment options immeasurably. This VPN use is both great for those on holiday or business trips, and for the more adventurous couch potato. Netflix has different libraries of content for subscribers in different regions, which means that no one can actually watch everything - there's always going to be some series or movie that's blocked in your country. However, with a Netflix VPN, you can connect to a server in a particular country and Netflix will respond by serving you the library of that region. Other services - like BBC iPlayer or Hulu - are only available to people in particular countries, with those elsewhere not entitled to watch anything on them at all. In the case of an iPlayer VPN, for example, you can change your location to the UK and watch everything available like a true Brit. There's a catch, though - all streaming services are consistently trying to stop VPN usage, and only the best can actually get users access to everything they want. Thankfully, though, there are some fast VPN services that consistently stay ahead of the curve and can get you watching whatever you want, wherever you are. Streaming VPN - explore the most reliable services for accessing Netflix and moreACCESS SITES ABROADVPN uses: Access sites when you're abroadMuch like streaming services, many other sites serve up different countries. However, if you're on a trip you'll want to access your regular version, but you'll be faced with a site that might be totally different - and quite possibly in a language you don't speak. If you've gone away on a weekend jaunt and forgotten to tell your bank, you might face being locked out of your account. If this is a possibility, it's worth flipping that VPN switch on and virtually heading home for a moment just to make sure your account isn't blocked, leaving you penniless abroad. Best US VPN - explore the best services for use in the States and abroadWATCH LIVE SPORTSVPN uses: Watch more live sports fanatic, you'll know that watching live events can get expensive pretty quickly. However, with a VPN and little bit of research, you could save a ton of cash - and perhaps even find a pay-per-view event for free. This is due to the fact that some sporting events are free-to-air in certain countries, while they're paid-for in others. In recent times we've found cheaper or even free ways of catching the NBA, Super Bowl, Euros and Olympics with a VPN, so if there's a big event on, it's well worth checking out global broadcasting options for a better deal. All you need to do is connect to a server in one of those countries and get watching. Plus, Tom's Guide runs down all the big events and how to watch them, so check elsewhere on the site for info on where to catch a cheaper (or even free) stream. USE FREE TRIALSVPN uses: Make sure to use your free trialThis one's not so much a use, but a way of making your money go further. If you scour the market, you'll see there are tons of VPN free trials available - and if your chosen provider offers one, make sure to use it!Plus, all our top-rated providers offer money-back guarantees, ranging from 30 to 45 days. If you're not sure about a service and it doesn't offer a true trial (for example, our #1 provider ExpressVPN), you can still trial it risk-free. All you need to do is buy a plan, and start using it. If you're not happy with it, don't be shy - just about every one of our favorite providers will refund you hassle-free.SPEED UP GAMING(Image credit: Lukmanazis/Shutterstock)VPN uses: Speed up your online gamingWhen people talk about VPNs, they often mention how all but the best inevitably slow down your internet connection. However, this is no always the case. Your ISP may 'throttle' your connection, meaning it slows down your internet when it detects certain activity - often those that use a lot of bandwidth. Prime suspects are online gamers, and while the same can happen when torrenting or streaming, in those situations a slow connection isn't a case of life and death. Whether you're still playing CS:GO, have moved on to PUBG. Apex Legends and Call of Duty, or prefer to humiliate your friends on the digital football pitch rather than shooting them in the head with an AK-47, a VPN can make sure your connection remains stable and reliable, and help you keep up your winning streak for as long as possible. Read more about the best gaming VPN servicesSTAY SAFE ON HOLIDAYVPN uses: Stay safe on holiday abroadIf you're heading to a different country, data laws may be different country, data laws may be different and government censorship could be common. In these cases it's clear you'll want to use a VPN (for example, a Turkey VPN), but even if you're heading to a more 'friendly' country, a VPN could still be useful. You'll be able to access sites as you would at home (no more guesswork if you're Googling in Japan), and stream content you're used to back home. The only issue is that you might not find that you've got much of a use for your VPN when you get home. We'd disagree with that (just look at all the reasons above and below!), but if you don't want to keep paying for something you'll never use, check out a monthly VPN plan. They're cheap and require no commitment - perfect for staying safe on a holiday. AVOID TRACKERSVPN uses: Avoid trackers Your data and internet history is just that - yours. So, it's quite understandable that many people take issue with the fact ISPs and governments collect this data and use it for their own gain. While many may argue that government tracking is legitimate, the techniques used are like a trawler fishing boat. Yes, they might catch what they need to, but the by-catch is vast. If you want to avoid getting your data caught up in that net without your consent, a VPN is the answer. However, your ISP's uses of your data might be rather less noble. While they already make money from your internet subscription, many top up their pay packet by selling users' personal data to advertisers. If you want to avoid targeted advertisers and feel a little more free to search for what you want without people keeping tabs, using a VPN can make that happen. SPOOF YOUR GPS LOCATIONVPN uses: Spoof your GPS location While this VPN use isn't as well-known as others - and won't be useful for everyone - spoofing your GPS location for Pokemon GO, for example, you'll need to either combine a VPN with a GPS spoofing app, or use Surfshark, the only VPN with a built-in GPS changing tool. As the best fake GPS VPN, Surfshark combines solid VPN performance with a GPS spoofer on Android, which means you don't have to rely on any third parties to change your location. This isn't just good for Pokemon GO, though, and can be very handy for ensuring your exact location isn't being tracked by any number of apps. SAVE MONEY(Image credit: NordVPN) (opens in new tab)VPN uses: Avoid location-based price targetingMost prevalent amongst car hire and plane ticket merchants, being offered different prices depending on where you are and what you've searched is more common than you may think. If you're thinking of purchasing a digital product - whether that's Microsoft Office, a game, or Spotify - taking a moment to check prices from around the world might save you a good wad of cash. Those in lower-income countries are usually offered a cheaper price, but that's not always the case. In practice this process is often more trial-and-error than exact science, so having a VPN with plenty of servers worldwide is worth the investment and could end up paying for itself. This also ties into the earlier benefit of avoiding trackers. If you've searched for a product a number of times without purchasing, the seller will often inflate the price to urge you to buy sooner rather than later - this is most commonly seen with plane tickets, but not unheard of with other products. With a VPN, you'll be seeing the true price and potentially saving yourself serious money. Cheap VPN - save money on your VPN as well as avoiding price targeting PROTECT YOUR MOBILEVPN uses: Protect your mobile devices If you sign up to a good provider, you won't just get a Windows 10 VPN - almost all top-quality services have apps for Android and iOS, and some even still support BlackBerry. By using a VPN on your mobile device, you'll be connecting to public Wi-Fi the most is likely to be your phone, it's a sensible decision. All our recommended VPNs allows at least five simultaneous connections, with some offering up to 10, and in rare cases unlimited connections. So, if you've got a lot of devices you want to keep safe, make sure that your chosen provider can offer enough simultaneous connections for your needs. AVOID ISP RESTRICTIONSVPN uses: Avoid ISP restrictionsFor those who don't have control over their internet provided for them - a VPN could be the only way to access content that's restricted. While parental control tools certainly have their place, for many they're imposed when they really have no right to be. We're not just talking about adult content, either - these controls are often heavy-handed in their censorship and regularly block innocent sites. Also, they can limit in-app purchases and impose restrictions on how much time is spent on the web, and when. Another section of the web that's usually blocked by ISPs regardless of whether you're subject to parental controls or not is torrenting sites. We in no way condone the use of torrents for downloading content that breaches copyright laws, but for legal use, VPNs can give you access to torrenting sites and services. Whatever your reasons for wanting to bypass ISP restrictions - and as long as you're legally entitled to - a VPN is a simple way to get access to the uncensored internet everyone else can view. TORRENT SAFELYVPN uses: Torrent safely and anonymouslyAs mentioned above, we do not condone the use of VPNs or torrenting software to download content that breaches copyright laws. P2P sharing is an efficient way to share large files with ease, but it also puts users at risk. When downloading or seeding a torrent, your IP address is visible to others who are connected at the same time. Torrents also open ports that are usually inaccessible to outside parties, and both of those things are opportunities for hackers access your data. While only the best antivirus (opens in new tab) can protect you from the threat of malware hidden in torrents, a VPN will give you the peace of mind that your data is safe and you won't be personally identified. However, while being victim to a hacker is somewhat unlikely, the biggest downside to torrenting is the fact your torrent slow to a crawl, but your general browsing will also be affected. A VPN anonymizes all your traffic so your ISP can't tell what you're torrenting, and subsequently you'll have full speeds all the time, no matter what you're doingTorrenting VPN - keep yourself protected and avoid network throttlingSAFELY USE PUBLIC WI-FI(Image credit: Shutterstock)VPN uses: Stay safe when using public Wi-FiUsing unsecured Wi-Fi hotspots is another risky practice that's rendered harmless by simply using a VPN. If you visit public spaces like cafes to work, or connect to Wi-Fi in the supermarket, public transport or bars when you're out and about, there's a genuine possibility that your data is at risk. If the connection you're on is unsecured (possible) and unencrypted (likely), there's a real chance that data thieves will have identified it and are using it to steal your personal information. That's usually done by a 'Man in the Middle' attack, which works by intercepting any and all the data you put out over the connection. That could include social media and email logins, credit card details and even your online banking credentials. If you want to protect yourself from this, using a VPN will encrypt all the traffic going to and from your device - even if your connection is intercepted, the details will be totally unreadable and useless to any criminal. Read more about the best Android VPN and the best iPhone VPN to stay safe on the go.MAXIMISE YOUR BANDWIDTHVPN uses: Maximise your bandwidth Expanding on the torrenting section above, your internet speed slowing to a crawl when doing certain things on the internet, or at peak times, your ISP may be reducing your speeds based on your activity. This is easily remedied by using a VPN. No matter what you're using your connection for, if you're using a VPN your internet provider won't be able to tell what you're using a VPN. No matter what you're using your connection for, if you're using a VPN your internet provider won't be able to tell what you're using your speeds based on you connection. While VPNs can minimally reduce your peak speeds (by as little as 5% for the best, and unlikely to be noticeable unless you have a gigabit line), throttling can be far more severe than that. If you want to be able to rely on your connection 24/7, a VPN can help you get the most out of your internet service. AVOID CENSORSHIPVPN uses: Avoid government censorshipFor many, internet freedom might seem like a given, but those living in China, UAE, Iran, Syria and many more have severe internet restrictions imposed at a governmental level. For citizens of those countries, a VPN is the only way to access sites others take for granted - Wikipedia, Facebook, Twitter, non-state news sites, Google... However, not every VPN is powerful enough to sidestep these regimes, so it's worth doing your research. Also, while those living in these countries are permanently subject to this censorship, holidaymakers, business travelers, reporters and many others spending time in these countries will also find their access to everyday sites reduced. For those that rely on Gmail or Slack to get work done, a VPN is an absolute essential. Our China VPN list details services that can bypass the Great Firewall, but should also work to evade other government censorship around the world. USE VOIP (Image credit: ExpressVPN) VPN uses: Access free VoIP services like WhatsAppStrict national governments with huge stakes in mobile networks will often restrict access to free VoIP services like WhatsApp, Skype, Messenger and more because doing so ensures they make more money. This is a huge reason why you might want a UAE VPN when living or traveling to Dubai or elsewhere, and while rules change frequently, it's been known for UAE residents to have to use a VPN to even access voice chat on video games. Paying for a VPN and using free VoIP services usually ends up costing much less than \$2.50 a month - is a great way of saving cash and staying in contact with loved ones. KEEP MESSAGING PRIVATEVPN uses: Keep your online chats privateWhile there are a number of secure messaging apps available (Signal and Telegram to name a couple), many popular apps don't offer encryption, or require you to opt-in rather than opt-out. If your messaging isn't encrypted there's a chance it could be intercepted by an outsider. By using a VPN you can ensure that your messages are seen only by the intended recipient, meaning you can be as open as you want to be. Also, while it won't affect your regular cell signal, a VPN can help protect your VoIP calls. And, even if your service provides encryption as standard, using a VPN as an extra layer of protection will give you the reassurance that you really can speak your mind. Read more about the best mobile VPN apps available todayACCESS HOME NETWORKSVPN uses: Access home networks securely Unless you take all your hard drives out with you when you go to work or on holiday, your entire repository of files and data likely lives on one computer at home (with a couple of backups, or course). If this is the case, you might have remote access this machine and the info it contains when you're away from it. However, keeping that data safe should be a priority, so using a VPN to encrypt your traffic when remote accessing your main PC in a nobrainer.ACCESS COLLEGE NETWORKSVPN uses: Access work or university networks access to your school, college, or work's network may be limited geographically, and many institutions formally implement VPNs to allows users to access intranets or other data repositories. This is usually done through the use a static IP, something the best business VPN will offer. However, we've also heard stories of students moving back home - to Canada from the US, for example - and ending up unable to access their school's networks from outside the country, while others found that their location breached some kind of regulation. By using VPNs, in this age of remote learning these students were able to essentially have their cake and eat it - they could complete their studies while also living where they wanted to. If this sounds like you, we'd check out a VPN straight away.
